Description			
<p>To save flash space it would make sense to allow zconf++ to detect any pre-compressed files when a url is requested. Example : "get /js/big.js" will check for /js/big.js.gz and maybe /js.tar - big.js.gz</p> <p>As above example it might make sense to have a tar containing pre-compressed files to be used by http compression which can be extracted by zconf++ for browsers not supporting the compression method. If we do it in a tgz file we will need to decompress and maybe recompress each time we serve a request.</p>
